SKILLS

Languages Go, Java, JavaScript, TypeScript, Python, C++, C#, SQL
Frameworks Spring Boot, gRPC, JUnit, Cucumber, React, Angular, Vue.js, Flask, Mockito
Tools & Infra Git, Docker, Kubernetes, Kafka, Jenkins, AWS, MongoDB, Bash scripting, Scrum

EXPERIENCE

Compass — Software Engineer III Seattle, WA · Oct 2024 – Feb 2026

- Led the migration of a high-volume email notification platform (**4M+ emails/year**) to a **brand-agnostic templating engine**, enabling multi-brand support across the Marketing Center product during a company-wide **M&A integration**
- Built and maintained backend services in **Go gRPC** and **frontend components in React** supporting template publishing, brand-aware search, and **multi-org access control** for a platform serving thousands of real estate agents nationwide, all on AWS
- Identified and remediated a **critical authentication and authorization vulnerability** in a widely used API, mitigating an externally reported attack vector by implementing **role-based access controls**
- Led the migration of backend services to a **ReBAC-based authorization model**, coordinating implementation across a **globally distributed team**
- Adopted **AI-assisted development tools** (Augment Code, GitHub Copilot) **with TDD**, writing tests first, defining requirements, and letting AI generate implementation code, accelerating delivery without sacrificing quality

Mastercard — Software Engineer II Chicago, IL · Jan 2024 – Oct 2024

- Leveraged **Spring Boot**, **Postgres**, and **Kafka** to build services, schedule jobs, persist data, implement bug fixes, and enable **real-time data processing**
- Worked on the **Next Generation File Transfer (NGFT)** project, which facilitates file transfers between Mastercard, financial institutions, and other financial entities globally
- Improved test coverage with **Mockito** and **JUnit** across code repositories to meet industry and firm-wide **targets of 80%**

JPMorgan Chase & Co. — Software Engineer I/II New York, NY · Feb 2021 – Aug 2023

- Leveraged **Apache Spark** to transform large data streams and **modernize an ETL pipeline** for batch and real-time processing
- Used **Spring Boot**, **Kafka**, and related technologies to build applications throughout the entire SDLC
- Secured APIs using **OAuth2**, **OpenID Connect (OIDC)**, and other authentication protocols for app clients
- Configured security infrastructure: certificates, **Kafka encryption keys**, OAuth, and **Kubernetes secrets** for applications within scope
- Used **Jenkins** and **Kubernetes** to continuously deploy artifacts and manage configurations to ensure quality of work
- Transitioned applications from internal cloud environments to the public cloud on **AWS EKS**
- Configured distributed tracing with **Zipkin** and monitoring with **Prometheus** to identify and resolve **latency bottlenecks** in microservice architectures

Leidos — Junior Software Engineer Washington, DC · May 2019 – Feb 2021

- Developed components for a **Location-Based Access Control (LBAC)** system that dynamically enabled or disabled device functions based on physical location (e.g., SCIF entry/exit), using a hypervisor-managed UI layer and **BLE reverse beaconing** for zone detection
- Built **C++ data collection** experiments and **Python preprocessing pipelines** to train **convolutional neural networks (CNNs)** for device location inference, reducing computational overhead versus real-time BLE triangulation
- Built full-stack web applications using **Jersey with Angular and Vue.js** frontends, securing REST APIs with **certificate-based authentication** and **OAuth2** for **government defense systems**

EDUCATION

Rochester Institute of Technology

B.S. Computer Science and Cybersecurity · Golisano College of Computing and Information Sciences

Rochester, NY
